## LISTING OF THE CLAIMS

The following listing of claims will replace all prior versions, and listings, of claims in the application:

Claim 1 (original): A travel safety device for a vehicle comprising: an object detecting unit which detects an object existing in a traveling direction of the vehicle; a correlation calculating unit which calculates a correlation involving a distance between the vehicle and the object on the basis of a detection result of the object detecting unit; a safety unit including an automatic brake unit which automatically decelerates the vehicle and a seatbelt device which automatically tightens the seatbelt and releases the tightening thereof; and a safety device operation control unit which determines a possibility of a contact between the vehicle and the object on the basis of the correlation calculated by the correlation calculating unit and for controlling operation of the safety device when it is predicted that there is a possibility of a contact brake unit and seatbelt device when it is predicted that there is a possibility of a contact.

Claim 2 (original): The travel safety device for a vehicle according to claim 1, wherein the automatic brake unit is constructed so as to be capable of decelerating the vehicle in a plurality of different deceleration patterns, and the seatbelt device is constructed so as to be capable of tightening the seatbelt and releasing the tightening thereof in a plurality of different operation patterns.

1, wherein the safety device operation control unit is constructed so that, when the

Claim 3 (original): The travel safety device for a vehicle according to claim

distance between the vehicle and the object enters a predetermined range on the

basis of the correlation calculated by the correlation calculating unit, the automatic

brake unit causes deceleration of a degree, which is capable of making the occupant

recognize that a braking force has been generated, to be generated, and at the

same time, the seatbelt device alternates tightening of the seatbelt and releasing

thereof.

Claim 4 (original): The travel safety device for a vehicle according to claim

wherein the safety device operation control unit is constructed so that a further

higher degree of deceleration is generated by the automatic brake unit if such a

state is maintained for a predetermined period of time, where the distance between

the vehicle and the object enters a predetermined range on the basis of the

correlation calculated by the correlation calculating unit.

Claim 5 (original): The travel safety device for a vehicle according to claim

4, wherein the safety device operation control unit is constructed so that, if such a

state is maintained for a predetermined period of time, where the distance between

the vehicle and the object enters a predetermined range on the basis of the

correlation calculated by the correlation calculating unit, the seatbelt device causes

the seatbelt to be fixed in its stopped state for at least a predetermined period of

time after the seatbelt is tightened.

Claim 6 (original): The travel safety device for a vehicle according to claim 5, comprising: a braking operation detecting unit which detects a braking operation carried out by a driver; and a vehicle speed detecting unit which detects the speed of vehicle, wherein the safety device operation control unit is constructed so that fixing of the seatbelt in its stopped state by the seatbelt device is released in at least one of the states where it is detected on the basis of a detection result of the braking operation detecting unit that a braking operation is released after the braking operation is carried out by a driver and where it is detected on the basis of a detection result of the vehicle speed detecting unit that the vehicle stops.

Claim 7 (original): The travel safety device for a vehicle according to claim 1, comprising a braking operation detecting unit which detects a braking operation carried out by a driver, wherein the safety device operation control unit is constructed so that, on the basis of a braking operation detected by the braking operation detecting unit, it determines whether there is a possibility of a contact between the vehicle and the object, and increases a tightening tension of the seatbelt by the seatbelt device in a case in which it is predicted based on a braking operation carried out by a driver that there is a possibility of a contact prior to a case in which it is predicted, on the basis of the correlation between the vehicle and the object, which is calculated by the correlation calculating unit, that there is a possibility of a contact therebetween.

Claim 8 (original): The travel safety device for a vehicle according to claim

Application No.: 10/542934

Amendment Dated: January 18, 2008

Reply to Office action of: December 21, 2007

1, comprising an in-vehicle LAN, wherein the correlation calculating unit, a brake

control unit which controls the automatic brake unit and an electric seatbelt control

unit which controls the seatbelt device are connected to a connection bus of the in-

vehicle LAN.

Claim 9 (original): The travel safety device for a vehicle according to claim

1, wherein the operation of the seatbelt device is made different in a case in which

there is a possibility of a contact with a stationary object and in a case in which there

is a possibility of a contact with a mobile object.

Claim 10 (original): The travel safety device for a vehicle according to claim

1, further comprising a collision sensor which detects a collision of a vehicle, wherein

the safety device is further provided with airbag devices, wherein the safety device

operation control unit is constructed so that it simultaneously actuates the automatic

brake unit and the seatbelt device when it is predicted that there is a possibility of a

contact, and actuates the airbag devices when the collision sensor detects collision

of the vehicle.

Claim 11 (withdrawn): A seatbelt device comprising: a seatbelt which

restrains an occupant of a vehicle in a seat; a contact predicting unit which predicts

a possibility of a contact between the vehicle and an object; an electric motor which

tightens the seatbelt when a contact is predicted by the contact predicting unit; a

tightening releasing unit which releases the tightening of the seatbelt; and a control

unit which controls the electric motor and the tightening releasing unit; wherein the

control unit carries out a warning operation to issue an alarm to the occupant by

means of the seatbelt by controlling the electric motor and the tightening releasing

unit so that tightening of the seatbelt and releasing thereof are alternated.

Claim 12 (withdrawn): The seatbelt device according to claim 11, wherein a

time of tightening the seatbelt in the warning operation is set to be longer than a time

of releasing the tightening thereof.

Claim 13 (withdrawn): The seatbelt device according to claim 11, wherein

the control unit carries out the warning operation on the basis of a prediction signal

of the contact predicting unit.

Claim 14 (withdrawn): The seatbelt device according to claim 11, wherein

the control unit carries out a tightening operation of tightening the seatbelt by means

of the electric motor after the warning operation is carried out.
